

The book of dragons...(only supplementary reader of imaginative information)

6 0 1

Chapter 1 by Palaash Agarwal

Dragons. Invincible, highly flammable mouth and nostrils, antelope like horns, sails for temperature regulation, a spiky body acting as armor, bat like wings to fly, and a pointed tail to balance. This new book of dragons contains the amazing knowledge about these creatures you wouldn't know at all!

Differences between dinosaur and dragon

It is a common occurrence that mostly people get confused between both creatures, so let's first understand what is dragon and a dinosaur.

Here are 2 common examples of both creatures and differences.

Western Dragon Tyrannosaurus Rex

- flammable nostrils - bone crunching jaws and mouth
- bat like wings to fly - big head
- sails below horns on - small front limbs for balancing weight
- head for temperature - powerful hind limbs for sprinting
- regulation - spikes and colored skin (maybe) for
- antelope like horns for camouflage
- defense
- scaly spiky skin acting

as article

- vicious eyes

a) Wyverns(african dragons) and South American dragons ; these dragons have no hands but have limbs adapted for flying. Serpentologists have found out that these dragons have evolved from pterosaurs, with a proof. The jurassic one, rhamphorhynchus had got a long tail for balancing while flying.

Creataceous pteranodon had a crest which was used for balancing itself. And these are found in form of horns in wyverns. Small wyverns have evolved from rhamphorhynchus into pygmy wyverns while big wyverns and south american dragons have evolved from quetzalcoatlus.

b) Sea Serpents: they've evolved from mosasaurs and plesiosaurs. The flipper have changed into fingered limbs and they have evolved little wings. Thy have sails for easy swimming and long tail too.

c)Western Dragons and North American Dragons; They have evolved from Australian dragons which migrated in summers to Atlantic oceans.

Some Australian dragons came on land and then slowly, with no apex predators they evolved into both species, being dominant and developing cruel predator qualities.

d) Asian dragons; They evolved from prehistoric crocodiles, when they got extinct and evolved into generous Tibetan and Chinese dragons but the Mongolian dragon is an exception as it has evolved from a small crocodile.

e) Pygmy dragons; They evolved from the primitive dragon, megadraconis. They evolved into small pygmy dragons, which are relatives of wyverns.

f)Legendary dragons; These dragons are the most recent dragons to be discovered having no clear point from which creature it evolved, but it looks like they have evolved from bigger dinosaurs.
